

Top Content by Demographic

What pages each demographic group visits — including the content pages people browse **after** finishing the questionnaire. Filter by any combination of gender, age, education, and race to see the pages that slice of users viewed most.

Read these as within-group patterns, not site-wide totals. This view only covers users who answered the questionnaire's demographic questions — a small, self-selected slice of all traffic — and only from late May 2026 onward (when the raw GA4 export began). Groups differ hugely in size, so compare a page's **share within a group** across groups, not raw counts. Not provided = the user answered some demographic questions but not this one. Small groups get noisy fast — use the *Minimum sessions* filter to suppress thin rows.

Compare groups side by side

Pick one demographic to break the top pages out by. Each bar is that page's **share of its own group's** pageviews (the fair comparison, since groups differ in size). All the filters above still apply, so you're comparing within the current slice — leave a demographic set to *all* to compare every group in it.

Notes & definitions

- **How demographics attach to pages.** During the questionnaire, GA4 records the answer to each demographic question (gender, race, education, age) tied to the user's session. We roll those up to the user (`user_pseudo_id`) and attribute them to **every** page that user viewed in the export window — so a page read on a return visit still counts. Source: `usa2-brainguide.reporting.mart_top_content_by_demographic` (dbt), refreshed daily.
- **The four demographic filters combine (AND).** Selecting Female + 65-74 shows pages viewed by users who are *both*. Each defaults to all values selected.

- **Page type.** *Content only* excludes Home, Result, and the Go365 landing page — it's the "what else did they read" view. *Go365 landing only* isolates the partner (Humana Go365) entry page, which drops users straight onto the questionnaire; those users still flow on to the same result and content pages.
- **Not provided** means the user answered some demographic questions but skipped this one — distinct from *Prefer not to answer*, which they explicitly chose.
- **Coverage.** Only users who reached a demographic step of the questionnaire appear here — a self-selected minority, so totals are far smaller than the site-wide Top Content page, by design.
- **Compare within, not across.** Because groups differ so much in size, a raw count mostly reflects group size. Use *% of Selection* and filter to one group at a time to see what that group over- or under-indexes on.
- **Page path** is the primary identifier (e.g. `/alzheimers-prevention-keep-your-brain-healthy`); *Page* (title) and *category* come from `seeds/content_page_map.csv`.
- **Race** is multi-select in the questionnaire; anyone choosing two or more groups is bucketed as *Mixed*. Spanish-language answers fold into the same canonical labels.
- **History.** No data before ~2026-05-24 — unlike the main Top Content page, this view has no GA4 Data API backfill (that data has no session grain to tie an answer to a page).
