

User Journeys

Where visitors go **next** — and where they came **from** — one page at a time. Pick a page (defaults to the Home page) to see the immediate next step in each session, plus how people arrived. Choose a result page to answer "after someone gets their brain-health result, what do they click?"

Page-flow analysis relies on the within-session sequence of page views, which only GA4's raw event export preserves. In this property that export begins **17 May 2026**, so journeys cover mid-May 2026 onward and grow daily. Every other dashboard page keeps its full history — this window is specific to journeys.

Sessions Arriving	Landed Here Directly	Left the Site From Here	Exit Rate
64,626.0	58,021.0	48,300.0	74.9%

Where they go next

The immediate next page in the session after **Home**. (exit) means the session ended here.

Device breakdown

Arrivals, departures, and exit rate for **Home**, split by device (respects the date and traffic filters).

[> device_breakdown](#)[> 3 records with 5 properties](#)

Device	Arrivals	Departures	Exits	Exit Rate
mobile	37,772	37,765	28,212	74.7%
tablet	18,926	18,911	15,162	80.2%
desktop	7,928	7,849	4,926	62.8%

Exit rate ≠ bounce rate. "Exit" here means the session had no further *page view* after this page — it's built only from page-view sequence. A visitor can be highly engaged (GA4's bounce rate counts a session as engaged after just 10 seconds, a second page, or a conversion) yet still "exit" from a page, because questionnaire steps, PDF saves, audio, and outbound clicks fire *events*, not new page loads. So a high exit rate here is normal and is not the same as GA4's bounce rate on Site Traffic Overview.
